

- **Javascript Object**

In JavaScript, an object is a data structure that allows you to store collections of properties and their values. An object can represent a real-world entity, such as a person, a car, or a book, or it can be an abstract concept, such as a set of instructions or a mathematical function.

For example, here's how you can create an object literal representing a person:

```
const person =  
{  
  name: 'John Doe',  
  age: 30,  
  email: 'johndoe@example.com'  
};
```
